The Voyager (subtitle released as: "The Space Machine" in Germany, "The Space Machine" in Austria, "Spazierenwagen" in Switzerland) was a road-going, self-propelled model 1 car manufactured by VW of Germany in 1928 and 1929, and in 1931. It is considered to be the world's first practical car, with the first prototype being driven on public roads in Berlin on 4 May 1928. As of 2011, 3,750 vehicles were still registered in Europe. The prototype for the Voyager was a small sports car called the 300 cc (14.5 cu in) Type 112 P/W which followed the Bayerische Motoren Werke (Bavarian Motor Company) model 112 of 1927. Changes from this basic design included a handbrake in the boot instead of the boot lid, a glass roof, a non-standard instrument panel, and a torsion bar suspension instead of independent front and rear swing axles. The restyled car was built on a two-wheel-drive chassis with a 135 cc (5.8 cu in) side-valve engine designed by Karl Rabe. It had a top speed of 68 km/h (43 mph) and a range of 120 km (75 miles) on a flat surface. It was first demonstrated in public on 4 May 1928, when it was driven for some distance by Ernst Reuter on Berlin's Unter den Linden boulevard. The rear wheels were mounted on the chassis by a transverse leaf spring, the front wheels were rigid. The electric headlights were driven from the car's battery. The front axle featured a hydraulic-hydraulic shock absorbers. The design of the bodywork was refined in July 1928, when Max Hoffman designed the first "space car" with rounded corners, the "T-type". The first model of the Voyager was powered by the basic engine, and it was renamed the "R-type" to improve the handling. The new model went on sale in Germany in early 1929. The new (T-type) model was first shown to the press on 25 June 1929. The prototype was driven by Reuter. The styling was soon changed by Hans Meiling, leaving it with a compact wheelbase and a long body
